Weld Field Sheet

Read every number off the steel. Work down the page in the order the line runs.

FDQ-FRM-0037
Version 1 | Last update 11/05/2026

Date	Project or spread	Alignment sheet, or line and iso	QC tech	Page

Last pipe or piece from the previous page

START

Pipe or piece no.	Heat	From (date, page), or first on the line

Welder stencils as they sit on the pipe. Top row nearest the weld.

How to use the Weld Field Sheet

FDQ-FRM-0037

Print this on the back of the sheet.

Before you start

- Have what tells you where you are and what's coming: the alignment sheet and the tally on a mainline, the iso and the spool packages inside the fence, and the qualified welder list.
- Copy the last pipe or piece from the previous page into **START**. On a new string or a new line, START is the first one.

Down the page

- Work in the order the line runs: station order on a mainline, the way the line runs on the iso inside the fence. Each heavy box is a weld. The material above it is Side A and the material below it is Side B.
- **WELD:** the weld number, and in Notes whatever a reader needs: the station on a mainline, the joint type inside the fence (Butt, Socket, Branch, Fillet), and a flag when there is one (Tie-in, Pup, Golden, Field fit, Attachment, Cut-out repl.).
- **Stencils:** copy the welder IDs the way they sit on the pipe. The top row is the layer nearest the weld (root and hot), the bottom row the next layer out (fill and cap). Eight boxes covers eight welders. Get them before the joint's coated.
- **MATERIAL:** the pipe number, or the spool, tag or piece mark, and the heat, read off the steel twice. A valve's heat comes off its weld end. Length is what goes in the line, measured with a tape. If the tally disagrees, the steel wins. Write it in Notes.

Pups, branches and existing pipe

- A pup is just the next pipe. It takes its parent's number plus a letter, and its parent's heat. Note the cut on the parent's row and on the cut pipe log.
- Write a branch, socket or attachment weld where it comes off the run, and say what it's on in Notes, like "on FP-02". When the branch ends, write where the run picks up in **NEXT**.
- For the owner's existing pipe, write EXISTING for the piece and the heat, and the owner's line number in Notes. Never guess a heat.

Repairs and cut-outs

- A repair doesn't change the material. Write R1, the date and the repair welder in the original weld's Notes, and log it on the repair log.
- A cut-out is never erased. Draw one line through the weld number, write VOID, the date and where the new welds are. The replacement welds and their pup go on that day's sheet with new numbers.

End of the day

- Line out the rows you didn't use. Copy the last pipe or piece to NEXT, and to START on the next page.
- Count on the day's last page. Every pipe or piece has one weld above it, so the two counts match. If they don't, a weld or a pup is missing. Then check the pipe against the tally.
- Hand the day's sheets to your inspector to check against the steel and sign.

Into the weld log (FDQ-LOG-0001)

- Each weld box is one line on the log. Side A is the material above it, or the piece named in Notes for a branch, and Side B the material below. The top stencil row goes in Root/Hot and the bottom row in Fill/Cap (one Welder column on the facility tab). Wall and grade come off the tally, size off the iso.
- Type it in the same day, while the pipe's still showing.
